SUPPLEMENTAL WATERING DIY

Are your trees getting brown and crisp? APlus offers various treatments to give drought-stressed trees a boost, but they only help so much if the trees aren't getting enough water!

To keep your drought-stressed trees happy and get the most out of our Tree Health Care treatments, water frequently in dry months. Here's how to set up your DIY Watering System.

- Get a soaker hose.
- Coil the hose around tree trunk and within drip line (tree canopy).
- Set it on low flow overnight.
- Repeat about once every 2 weeks until the cool rainy season is here.

Drought-Stressed Trees

Healthy Trees

Soaker hoses come in many lengths. The porous material allows water to seep out along entire hose.

PRO TIPS

Most roots are within the top 3 ft of soil. Water slowly and deeply.

Not sure when to water? Dig a small hole in the soil 4" deep. If it's dry, time to water!

Add a 2-4" thick layer of mulch to retain moisture and feed tree roots.

To prevent trunk rot, don't let mulch and soaker hose directly touch the tree trunk.

Coil soaker hose around base of tree, keeping hose slightly away from trunk base.
